■ **Application Information**

**Input Capacitor:**

A 1 $\mu$ F ceramic capacitor is recommended to connect  $V_{IN}$  pin as close as possible which is used to provide low impedance path to unwanted signal or noise. Larger input capacitor may be necessary if fast and large load transients are encountered in the application. For PCB layout, a wide copper trace is required for both  $V_{IN}$  and GND.

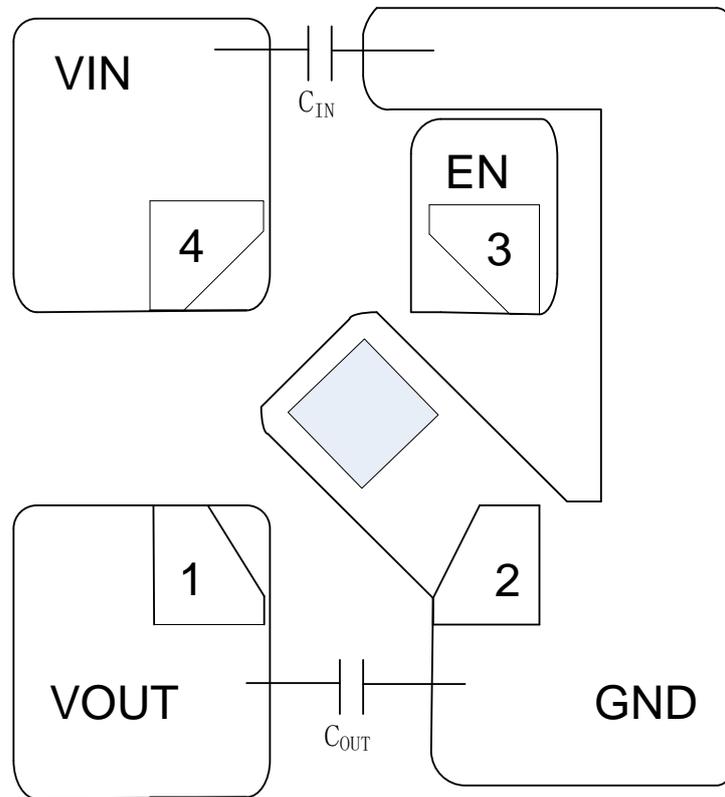

**Output Capacitor:**

The output capacitor is required for the LDO stability. The recommended output capacitance is from 1 $\mu$ F to 4.7 $\mu$ F, Place output capacitor as close as possible to  $V_{OUT}$  pin, Equivalent Series Resistance (ESR) is from 5m $\Omega$  to 100m $\Omega$ , and temperature characteristics are X7R or X5R. Place output capacitor as close as possible to  $V_{OUT}$  and GND pins.

**ON/OFF Input Operation**

The OCP1303A is turned on by setting the EN pin high, and is turned off by pulling it low or floating. If this feature is not used, the EN pin should be tied to  $V_{IN}$  pin to keep the regulator output on at all time.
